

Problem

Provide a design for a notification system. Feel free to use any diagramming tool for your answer or use this free one: <https://draw.io/>

Design Constraints

The system should support the following:

- The system supports push notification, SMS and email
- It is “soft real-time”, if the system is under high load then a slight delay is acceptable
- Supported devices are iOS, Android and laptop/desktop
- Notifications can be triggered from a client device or scheduled on the server-side
- Users who opt-out will no longer receive notifications

Considerations

Take the following into consideration for your solution:

- Reliability
- Scalability
- Performance
- Security

Example of a Design

Here is an example design that solves a different problem, how to shorten URLs like tinyURL
